WORK EXPERIENCE

Software Engineer

FEB 2026 - PRESENT

- Architected and shipped two published iOS applications end-to-end: an App Store game with 150+ users, and Fluctra, a real-time multiplayer puzzle game on web and iOS
- Managed the full product lifecycle across both of the applications: App Store review compliance, release management, analytics instrumentation, and roadmap prioritization

Data Annotation | Analyst

SEPT 2025 - JAN 2026

- Wrote code samples and reviewed technical content across numerous programming languages to support clients, consistently meeting quality benchmarks and identifying errors across high-volume task queues

PROJECTS

Fluctra | Swift, SwiftUI, JavaScript, Supabase, Firebase - fluctra.com

- Architected a dual-database backend for a real-time multiplayer puzzle game: Supabase (Postgres with Row-Level Security) for durable accounts, scores, and in-game economy, and Firebase Realtime Database for live battle state and matchmaking
- Built and shipped the web client in vanilla JavaScript with no framework, implementing drag-select tile matching, a shared daily puzzle with a global leaderboard, and progressive difficulty across endless and timed survival modes
- Built a fully native iOS client in Swift and SwiftUI against the same serverless API as the web client, keeping game state consistent across platforms; live on the App Store

Dungeon Break | *Swift, SpriteKit, Xcode*

- Architected and solo-developed Dungeon Break in Swift and SpriteKit from a concept to App Store launch, managing the whole development lifecycle
- Monitored analytics post-launch, detected balance issues, and eventually shipped a full update within two weeks, directly improving user retention and allowing for more than 150 downloads
- Designed a combat system that supports hero rarity levels, skill trees, and distinct dungeon zones, structuring the codebase for updates without the need for architectural rewrites

Real-Time Chat Server | *Node.js, Socket.io*

- Required a messaging system that can support multiple simultaneous room types; architected a WebSocket server handling public, group, and private channels with low-latency bidirectional communication
- Designed room-based namespacing and connection state management to allow for the clean isolation of message streams across concurrent users

Spotify Playlist Organizer | *React.js, Spotify API*

- Needed to ensure that third-party authentication is secure without the need to store user credentials; developed full OAuth flow, token refresh logic and Spotify API handling
- Built a dashboard for playlists with features, including live song search, mood/genre filtering, and user preferences, providing a seamless experience for the user across sessions

EDUCATION

CARLETON UNIVERSITY

Bachelor of Computer Science

Specializations:

- Reinforcement Learning
- Software Engineering
- Web Applications
- Operating Systems
- Database Management
- Programming Paradigms
- Artificial Intelligence
- Data Structures

SKILLS

Languages:

JavaScript, TypeScript, Python, Java, C++, C, Rust, Swift, SQL, HTML/CSS, Haskell, Prolog

Frontend:

React.js, HTML5, CSS3, Canvas API, Tailwind CSS, Responsive Design

Backend:

Node.js, Express.js, RESTful APIs, MongoDB, SQLite, Socket.io, Spotify API, Docker

Tools:

Git/GitHub, Claude Code, UML, Design Patterns, QT Framework, Linux, AWS, Agile Development, Xcode, CI/CD, REST APIs, NoSQL

CERTIFICATIONS

- AWS Educate
  - Cloud 101 (2024)
  - AWS Management Console (2024)
  - Cloud Literacy (2024)

ACHIEVEMENTS

- Second Dan Black Belt Taekwondo (2018)
- Guitar Repertoire Level 7 (2017)
- Competitive Swimming (2016)
